

Team HTML: Project Proposal – Dormitory Management System

Problem Statement

Managing a boarding house or dormitory manually is time-consuming and prone to errors. Owners and administrators often struggle to keep track of vacant and occupied rooms, tenant information, monthly rent due dates, and payment histories using notebooks or scattered spreadsheets. This makes it difficult to monitor overdue payments, respond promptly to maintenance concerns, and generate accurate income reports. Without a centralized and organized system, mismanagement can lead to lost records, delayed rent collection, and an overall inefficient boarding house operation.

Objectives

The Objectives of the Dorm Hub are:

- Provide a centralized system for managing tenant and room information.
- Simplify tenant registration and room assignment processes.
- Accurately track monthly rent and maintain organized payment records.
- Allow tenants to easily submit and monitor maintenance requests.
- Give administrators real-time visibility of vacant and occupied rooms.
- Generate reliable monthly income reports for better financial tracking.

Proposed Solution

Dorm Hub is a Boarding House / Dormitory Management System designed for two types of users: Admins and Tenants. The system centralizes room management, allowing admins to easily register tenants, assign rooms, and monitor real-time vacant and occupied room status. It also automates monthly rent tracking and keeps detailed payment records, reducing the risk of missed or unrecorded payments.

Tenants can submit maintenance requests directly through the system, allowing admins to address concerns more efficiently. In addition, the system automatically generates monthly income reports, giving administrators a clear and accurate overview of the boarding house's financial performance.
